Emergency Lighting – for Apartment Buildings

Emergency Lighting has what you need for every exit light and emergency light in the apartment building you maintain.

The safety code of the National Fire Protection Association (NFPA) can be confusing. Let our experienced staff help you navigate the requirements to make sure your residents are safe. The NFPA publishes the minimum standards for protecting occupants in buildings including apartment buildings. Your local jurisdictions may or may not follow these exact standards so you should consult your local ordinances on the subject of fire safety.

One of the important areas covered by the Code is emergency lighting, which is an essential element in aiding emergency exit from an occupied apartment building. When power fails and quick building evacuation is needed emergency lighting is critical.

Emergency lighting equipment must be used in new and existing apartment buildings where:

- There are 12 or more dwelling units
- Building more than 3 stories in height – unless every dwelling unit has a direct exit to the outside of the building (at grade level)
